On-Prem Git & SVN for Jira Cloud

Self-managed GitLab and Subversion in the Development panel of Jira Cloud, with nothing opened in the firewall

Runs on Atlassian
Atlassian Marketplace
Free up to 10 users

THE PROBLEM

Jira moves to the Cloud, the code does not. Self-managed GitLab behind the firewall and long-lived Subversion repositories stay on-premises, and Jira issues stop showing the commits and branches behind them. The official GitLab for Jira Cloud app needs an instance reachable from the internet, FishEye and Crucible reach end of support in May 2028, and Jira Data Center in March 2029.

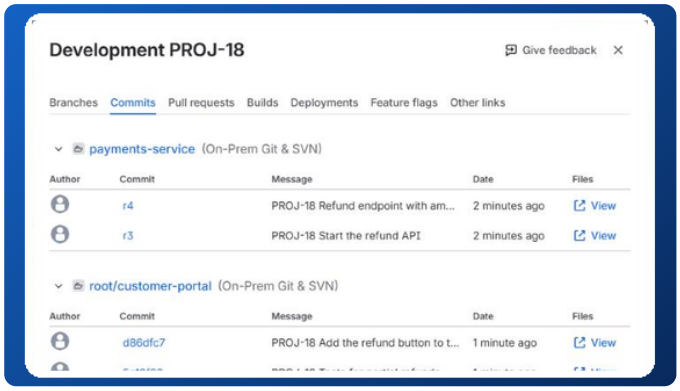

HOW IT WORKS

Your servers **send** the events; Jira never connects to your network. The app runs entirely on Atlassian Forge: no servers of ours, data stays in Atlassian's cloud with the data residency of the Jira site.

MAIN FEATURES

- **GitLab self-managed** (CE/EE 17.11+): commits, branches and merge requests with their status. One system hook covers the whole instance.
- **Subversion**: revisions (shown as r1234) and branches. One command installs the hook on every repository of a server, Linux or Windows, VisualSVN Server included. Corrected log messages update Jira; history can be imported.
- **Nothing lost silently**: events are kept until Jira confirms them. Missed GitLab pushes and missing SVN revisions are detected and shown on the app page with the exact command to fix them.
- **Linked by issue keys** in commit messages, branch names and merge request titles.
- **Authors**: GitLab e-mails, and SVN user names mapped to e-mail addresses, so Jira shows the person.

TYPICAL USE CASES

- **Data Center to Cloud migrations** where GitLab or SVN must stay on-premises: banking, public sector, defence, manufacturing, healthcare.
- **Replacing FishEye/Crucible** for linking Subversion to Jira.
- **Security policies that forbid inbound access**, where the official GitLab app cannot be used.
- **Mixed estates**: GitLab for new projects and SVN for legacy ones, in one app.

SECURITY AND QUALITY

- Runs on Atlassian; no calls outside Atlassian. Secret token per installation, regenerable; admin-only app page. No source code, diffs or file contents are ever received.
- 800+ automated tests with full coverage, mutation and chaos testing, contract tests with real GitLab and SVN payloads, end-to-end runs on real servers and Jira Cloud.

AT A GLANCE

Setup	About 5 minutes per server
Requirements	Jira Cloud; GitLab self-managed 17.11+; any SVN server (sh + curl on Linux, PowerShell 5.1 on Windows)
Pricing	Free for up to 10 users; per-user pricing above on the Marketplace, with a free trial
Support	English and Italian, support@steadyseam.com

Marketplace: marketplace.atlassian.com/apps/3886630403
